Overview

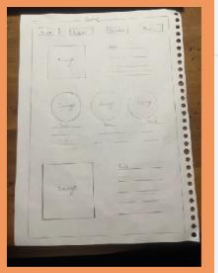
The website of the Ice World In Iceland offers the engaging and user-friendly platform to showcase the luxurious amenities and the unique experiences available at the resort. The website targets the adventurous travelers and the relaxation seekers who are interested in exploring the natural wonders of Iceland while enjoying a comfortable stay.

Audience

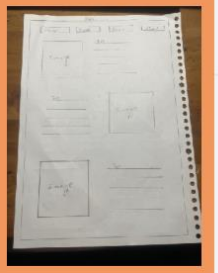
1. The Adventure Seekers
2. The Nature Lovers
3. The Couples and honeymooners
4. The Wellness and Relaxation Enthusiasts

Personas:

Low-fidelity Prototype



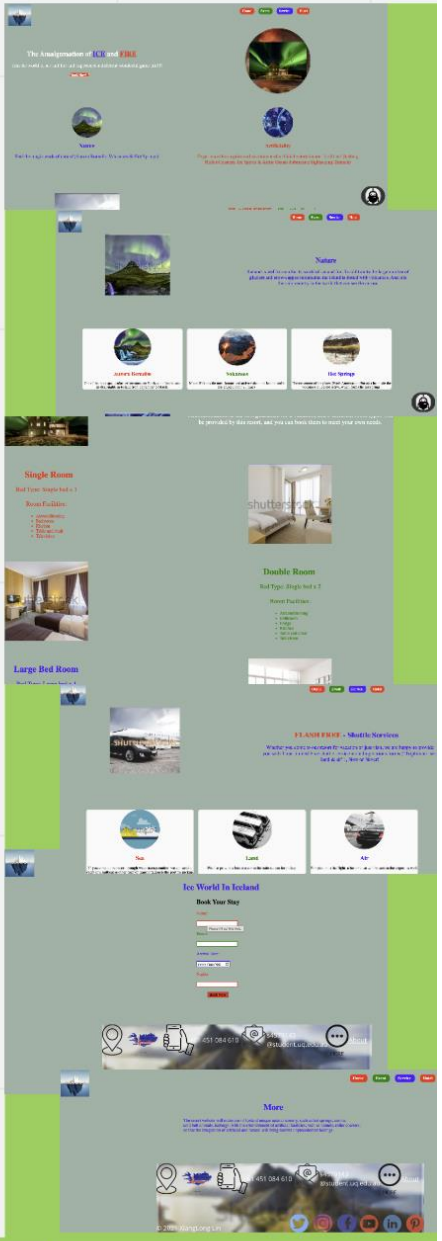
The low-fidelity prototypes provided the basic outline of the structure, with a focus on the usability and the function rather than the aesthetic. The key elements like the navigation menus, the content sections, and the calls-to-actions were identified. These simple sketches were invaluable in deciding the initial layout and workflow to identify the potential user-experience issues early in the design process.



High-fidelity Prototype

The high-fidelity prototypes offered the detailed and interactive preview of the resort. These prototypes incorporated the final design elements such as the colour schemes, the typography, the images, and the interactive elements. Therefore, the layout could be fine-tuned to ensure the visual and user-friend appeal.

Website Screenshot



The final iteration of the website incorporated the valuable feedback received from the user testing and the JavaScript functions for the enhanced interactivity. The features were added such as the responsive chat box for the real-time assistance and the dynami carousel gallery to showcase the stunning visuals. Furthermore, the background was changed into a pure colour scheme instead of the image to enrich the readability and the focus on the content.

Reflection

Throughout the design process, the value of conducting the user research to better understand the needs and preferences from the target audiences is learned, and the insights into creating an intuitive website layout that balances the aesthetics with the functionality are also gained. Moving forward, it is aimed to continuously improve the website based on the user feedback and the industry best practices.

The importance of the user-centred design and the role of prototyping in collecting the valuable feedback is realised, and the necessity of the responsive design in the current multi-device usage scenarios is learned. Despite the challenges in balancing the feature-richness and the simplicity, the opportunities for the growth and the understanding were offered. It is looked forward to implementing the potential improvements and the learnings in the future projects.

Future Work

1. The integration of a booking system for the seamless reservations
2. The expansion of the website to include the additional languages for the international visitors
3. Adding the virtual tours of the resort and the surroundings
4. The implementation of the user-generated content (e.g., reviews, photos, and videos) to foster the sense of community
5. Enhancing the accessibility features of the website to cater to the diverse users
