DECO1100/7110

IDEATION PORTFOLIO (15%) (Individual)

Due 19 April at 14:00.

Submit your research portfolio through Blackboard. This will be a *Turnitin* assignment (plagiarism detection).

Purpose

The main aim of the Ideation Portfolio is for you to report on how you as an individual contribute and benefit from working in a group on the Ideation phase.
After understanding the users and the context they operate in, you and your design colleagues (your group) will work on addressing design opportunities or problems. The group will settle on one context and decide on a design opportunity or problem you are going to design for. You will be exploring a variety of Ideation methods and working with peers from your course.

In this assignment, you will *report your group's design work through the ideation phase and your own contribution to the group's design work*.

In the ideation phase, you will focus producing different design solutions, addressing the design implications you and your group establish in the research task. Ideation is about coming up with a large quantity and broad diversity of ideas.

The design brief: Inclusiveness – how do we design inclusive experiences?

How might we design site-specific technologies that promote certain people to collectively experience a site?

The world is a divergent place, with many different people. We live in a time that is anxious at the moment because of uncertainty and worries. People are expressing concerns such as feeling lonely and isolated. There is a need for everyday delights, such as small gestures that can help people and improve their everyday experiences. As designers, you will apply human-centred research approaches to investigate people's existing experience of the context your team has chosen, and to help you begin to imagine how experiences might be augmented with technologies that you design.

- *Site-specific* means that the things we design will be tailored to particular locations. The team you work with in Studio will choose a context that you will focus on.

- *Certain people* refer to a target community that you are free to identify and define. Perhaps it is a particular student society, a group of friends, "familiar strangers" (e.g. people who regularly catch the same bus or line up for coffee at the same times), share a native language, live in the same neighbourhood, etc. You are not designing for everyone, just for some people who have something identifiable in common.

- *Collective experience* is social. It is something we share. We might experience it with others, in others' company, or through others' actions, but the experience is shared.
- *Inclusiveness* means that people feel valued and included in existing communities.

The experiences can convey magic, whimsy, wonder, curiosity, excitement, intrigue, surprise, delight, otherworldliness, but it should be a positive experience for the user.

Deliverables

You will work with peers from your studio session and use the work done in the studio sessions as a base for your own individual Ideation Portfolio. To enhance your individual portfolio, you will need to add personal reflections and arguments for your choices of methods. The ideation portfolio will consist of at least the following:

1. Introduction. An introduction to *your team*, and what qualities each member brings to your team. Present the *context* and a summary of what *design opportunities* or *problems* your team is focusing on in your design. Remember to present an overview of the insights and research implications your team has gathered after you all did the research portfolio. The introduction also needs to contain a description of the *user group* you are planning to focus on.
2. Methods. In this section you will need to present at least two ideation methods you have used for generating design ideas. Describe the methods, how they work, background of where they originate from and present a selection of ideas that you came up with when using the method. Reflect upon the used methods, explore pros and cons working with the method and support your arguments by using examples from your studio sessions.
3. Design ideas and story board. A section that presents your evolution of design ideas (from studio sessions as well as your own work), generated from a bulk of *thumbnails* (75-100 thumbnails per person). Choose 2 design concepts and develop scenarios. Include how fringe users are considered in at least one of the *scenarios* and create one professionally presented *storyboard* of one of the scenarios.
4. Conclusion. Write a paragraph that concludes the Ideation process. The conclusion includes a summary of the design brief, a summary of the ideation process you have been part of and a summary of the pros and cons with the two main ideas that you came up with.
5. Appendix. Submit an appendix with your raw data, include notes, sketches, mind maps, concept maps or other raw material that was collected and used in preparation of this submission.

Criteria

Please see marking guide published on Blackboard.
