DECO1100/7110

DESIGN PROJECT (45%) (Team)

Due 8 June 14:00, 2023

Submit the team's design project report through Turnit In (link on BB, only one team member need to submit the report).

Aim:

It is time to put together all your research and iterated ideation into a final design. The presentation of your final idea will be in the form of a group report. You want to present a design that is new and something the group has come up with through the design thinking process. The design should make people think. The design can do this by encouraging people to interact with it, provoke them to see the world differently, invite them to explore, experience or shape the environment they live in.

As per your earlier assignments your design responds to following design brief:

The design brief: Inclusiveness – how do we design inclusive experiences?

How might we design ***site-specific*** *technologies that promote* ***certain people*** *to* ***collectively experience*** *a site?*

The world is a divergent place, with many different people. We live in a time that is anxious at the moment because of uncertainty and worries. People are expressing concerns such as feeling lonely and isolated. There is a need for everyday delights, such as small gestures that can help people and improve their everyday experiences. As designers, you will apply human-centred research approaches to investigate people's existing experience of the context your team has chosen, and to help you begin to imagine how experiences might be augmented with technologies that you design.

- *Site-specific* means that the things we design will be tailored to particular locations. The team you work with in Studio will choose a context that you will focus on.

- *Certain people* refer to a target community that you are free to identify and define. Perhaps it is a particular student society, a group of friends, "familiar strangers" (e.g. people who regularly catch the same bus or line up for coffee at the same times), share a native language, live in the same neighbourhood, etc. You are not designing for everyone, just for some people who have something identifiable in common.
- *Collective experience* is social. It is something we share. We might experience it with others, in others' company, or through others' actions, but the experience is shared.
- *Inclusiveness* means that people feel valued and included in existing communities.

Think about how your design can encourage the collective and inclusive experiences.
The experiences can convey magic, whimsy, wonder, curiosity, excitement, intrigue, surprise, delight, otherworldliness, but it should be a positive experience for the user.

Design Project deliverables:

1. A *low-fi prototype* for user testing.
2. A *video* communicating your design concept.
3. A *process report*, describing the iterative process you have worked with.

Low-fi prototype

To do user testing of your design concept, you need to create a physical low-fi prototype for a chosen part of your design. The prototype needs to be of a part that involves user interaction and where you can test as a minimum how well it works for a collective experience.

The prototype should make people think and allow them to interact with the prototype without having to follow instructions. You want to see how people will interact with your design when you are not there to guide them.

Video

Your final submission will be a short narrated or subtitled video, that introduces the user context and intended users. The video needs to clearly communicate how the users will be able to interact and engage with your design. You will be asked to present in a studio class during Week 12. The video should be no longer than 4 minutes, and must include:

1. *Introduction*. Describe the context where your prototype would be installed, the target user group, and what design criteria you are addressing with your design. (Recommended length: < 1 minute)
2. *Prototype demonstration*. Demonstrate how public and community can interact and engage with your design. It is recommended that you1 interact with the prototype, demonstrating how it would work. (Recommended length: 2 minutes)
3. *Conclusion*. Present how your chosen design fits the design brief, and how it supports at least one group of fringe users. (Recommended length: < 1 minute)

Report

In addition to communicating your team's final choice of design concept in a visual forum (the video), your team must submit a report of your iterative development process that contains the following elements.

1. Title page and Introduction. Give your design an appropriate title, introduce your specific context and user group that you are designing for. Write a few

paragraphs that explain your project to an external audience and what problem or design opportunity you are addressing with your design.

2. Research overview. Present your team's *research process*, methods, analysis and outcomes, including any key insights etc. gained from the first ideas for project, as well as additional research the team has since conducted. What were the problems and needs you identified for your users.
3. Design process account. Present your team's *design process*, methods, design iterations, development and outcomes. In particular you need to focus on how you have done your user testing, methods, how many participants, findings from testing and design implications from the user testing. The user testing is the bulk of this section.
   In this section you also want to include references to each team member's individual design workbooks such as pictures and sketches of ideas (note: you need to attach evidence from the workbooks).
   For this section, include:
   1. *a timeline* of your process and its activities
   2. an account of the *evolution and iterations of your ideas* and prototypes, generated (meaning you need to clearly describe how the design has evolved through the design process)
   3. 1 *frame analysis* considering different perspectives on the problem space you are working with
   4. *Details of user testing*, with photos included to identify examples from the user testing
   5. *Co-design workshop(s)* designed and conducted
4. Method and process reflection. This section will critically reflect on the methods you have used and the process you have followed, their outcomes and lessons. It will conclude with thoughtful recommendations for improvements to the process and a brief plan for promising avenues of future work (e.g. if another team was going to take up this project next semester, response to critique given after video showing).

Criteria

This project is used to assess all of the learning objectives of this course. A marking guide will be released on blackboard.
